# Behavioral Economics

Implications for Marketing and Consumer Insights

*Marcus Cunha Jr, PhD*

**Terry College of Business**  
*Master of Marketing Research*  
**UNIVERSITY OF GEORGIA**

# Agenda

What is Behavioral Economics?

Heuristics and Biases

Choice Architecture/Nudges

Consumer Unconsciousness

# **Classical Economics: Unbounded Rationality**

- We always pursue and achieve optimal options
- We are excellent at calibrating chances and risks and computing expected values
- Preferences are consistent across time and places
- Goods, services, and money of equal value are perfect substitutes of each other
- States of wealth determine how we fare against others

# Are We Rational Beings?

Conventional economic theories are normative (*how the world ought to be*)

- They suggest what we ought to be doing to maximize utility

Behavioral economic theories are positive (*how the world actually works*)

- They describe how we *behave*
- Individuals use mental shortcuts (heuristics) that lead to errors in perceptions and decisions (decision biases)
- “Bounded rationality” (Simon, 1955)

# Let's play!

## Rules (ultimatum game)

1. I'll select one of the players to receive hypothetical \$10
2. In order to keep some of this money, the player who received the \$10 has to offer a certain portion of the \$ to the other player ( $> \$0$ )
3. If the player who received the offer accepts the offer, each player keeps his/her portion of the \$10
4. If the player rejects the offer, neither player gets to keep any \$ and I get my \$10 back!

# We Think in Two Distinctive Ways

 System 1	 System 2
Fast, intuitive, efficient, habit-based	Reflective, controlled, resources consuming
Good at managing simple tasks	Good at Complex Tasks
Relatively nonconscious	Conscious
Simple Decisions	Complex Decisions

## B.E. Criticism of Market Research

- The vast majority of consumer decisions are based on System I
- However, a large bulk of Market Research is designed to evoke System II (“walk me through your laundry detergent purchase decision”)
- People often feel the need to comply with a request/question and will provide answers (even if meaningless)

# Examples of Irrationality

- Anchoring and inefficient adjustment
  - Context and framing effects
  - Temporal Effects
  - Mental accounting and hedonic editing
- Mental Accounting and Prospect Theory
    - Hedonic editing
  - Corrections (Choice Architecture/Nudges)

# Anchoring and Adjustment

**Terry College of Business**  
*Master of Marketing Research*  
**UNIVERSITY OF GEORGIA**

# What is Anchoring and Adjustment?

- Judgments tend to be anchored on numbers to which people are exposed
  - People generally fail to adjust their judgments as a result of the anchoring effect
  - Usually people are unaware of the influence of an anchor

Is the population of Turkey (the country) larger or smaller than 300,000 (or 300,000,000)

Larger than 300,000 (or 300,000,000)

Smaller than 300,000 (or 300,000,000)

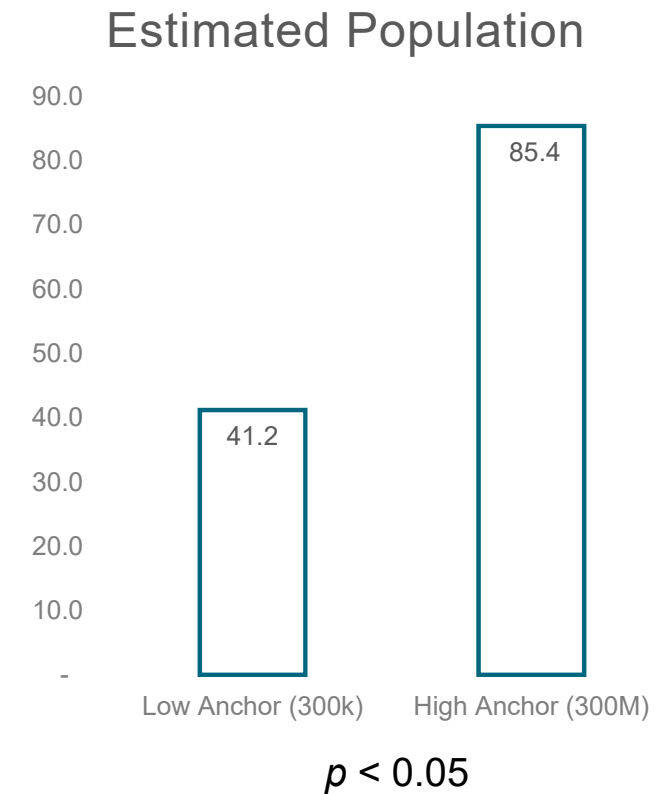

What is your estimate of Turkey's population? (Please use numbers only)

>>

# What is the population of Turkey?

Your answer may be influenced by the alternatives available on the survey

Did Mahatma Gandhi die before or after the age of 140 years old?

(vs. 9 years old)

Before

After

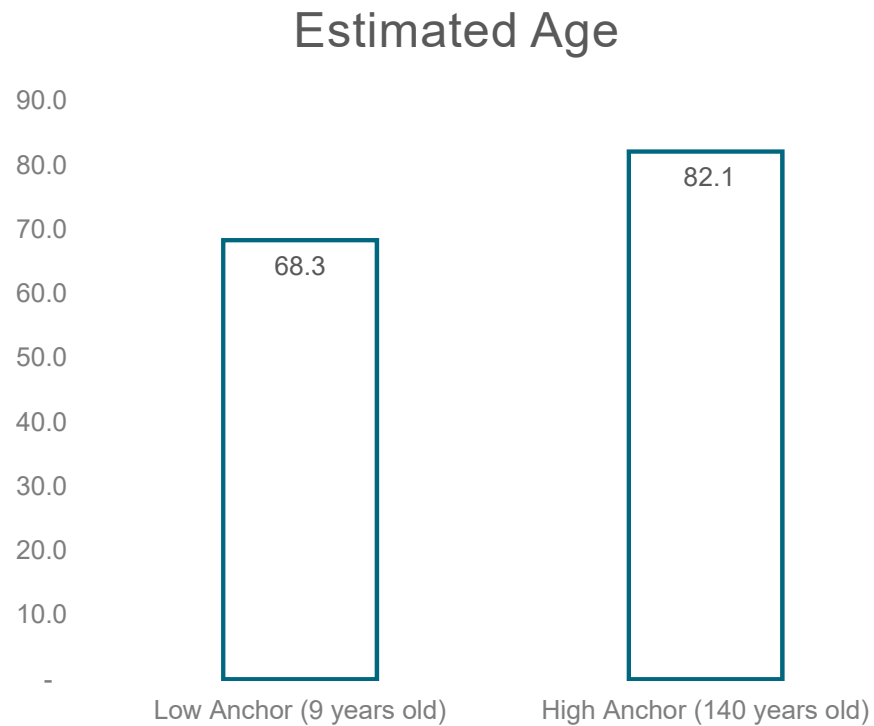

Please estimate how old was Mahatma Gandhi when he died:

>>

# How Old was Gandhi When he Died?

$p < 0.05$

Imagine you went to the grocery store and saw a sign that stated the following:

“Buy Snickers Bars for your Freezer” (**“Buy 18 Snickers Bars for your Freezer”**)

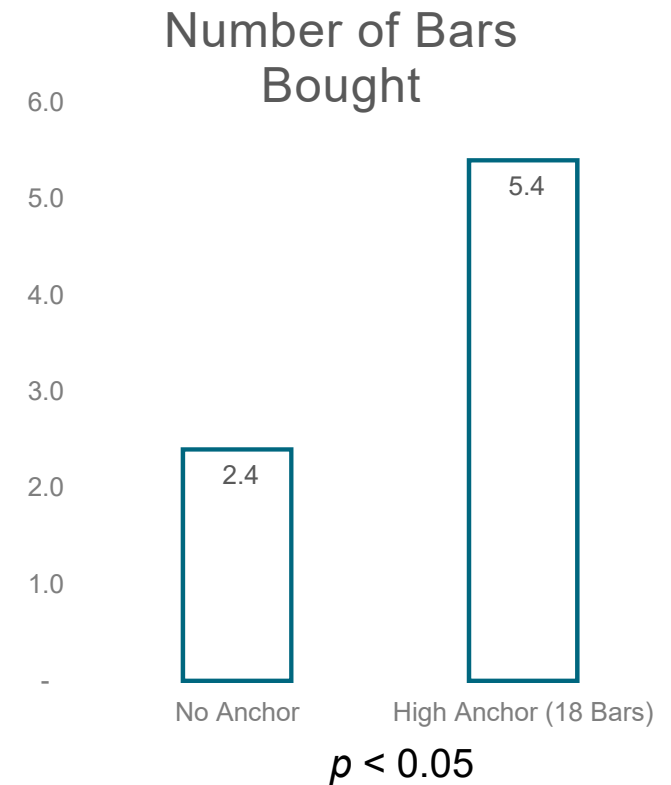

Assuming you like Snickers bars, how many bars would you purchase?

>>

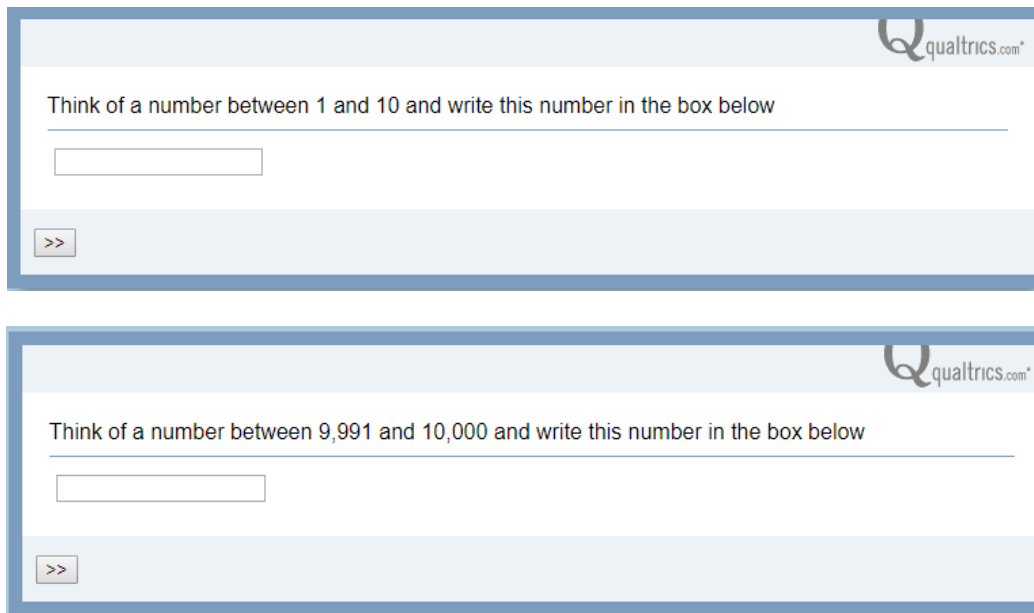

# How Many Snickers Bars Would You Buy?

Our behavior may be influenced by the store signage

# How many African Countries are Members of the United Nations?

The image displays two screenshots of a Qualtrics survey interface. Both screenshots show a question: "Think of a number between 1 and 10 and write this number in the box below". The first screenshot shows a low anchor, while the second screenshot shows a high anchor. Both screenshots include a "qualtrics.com" logo and a "Next" button.

Think of a number between 1 and 10 and write this number in the box below

Think of a number between 9,991 and 10,000 and write this number in the box below

qualtrics.com

A research team from the Computer Science department at a given university developed a new remote desktop software that features state-of-art data security. They consult the Marketing department for pricing strategy and, based on market research data, the estimated market prices for the different segments are the following:

---

What do you think is a fair price for a license for the Small Business version?

---

>>

Low Anchor	High Anchor
Personal: \$4.99/month	Personal: \$4.99/month
Family: \$19.99/month	Family: \$19.99/month
	Enterprise: \$299/month

# What's a Fair Price for a New Software Package?

## Small Business Package

Low Anchor	High Anchor
Personal: \$4.99/month	Personal: \$4.99/month
Family: \$19.99/month	Family: \$19.99/month
	Enterprise: \$299/month

## Price Estimates

## Implications for Sales and Marketing

“Buy Snickers Bars for your Freezer”

- vs. “Buy 18 Snickers Bars for Your Freezer”

Marked down prices

- increase the per-customer limit

Multiple uses

- 101 uses

## Implications for CR & I

The magnitude of values may influence responses (Anchor effect)

Answers to questions may be anchored on prior ratings/values

This may happen REGARDLESS of the meaningfulness of the anchor (e.g., last digits of your ph#, SSN, address)

•

# Context Effects

Does information seemingly  
irrelevant to the  
choice/judgment matter?

**Terry College of Business**  
*Master of Marketing Research*  
**UNIVERSITY OF GEORGIA**

# Contextual Decoys (and Phantom Decoys)

82 points, \$13.99

87 points, \$12.69

70%  
50%  
90%

73 points, \$6.69

30%  
50%  
10%

67 points, \$7.99.

Wine rating scale: 60-69 Wines are flawed and not recommended, 70-79 Wines are flawed and taste average, 80-84 wines are above average to good, 85-90 wines are good to very good

# The Psychology of Decoys: Perceptual Contrast Phenomenon

# Decoy Study

	One-year subscription to the print edition of <i>The Economist</i> and online access to all articles from <i>The Economist</i> since 1997.	

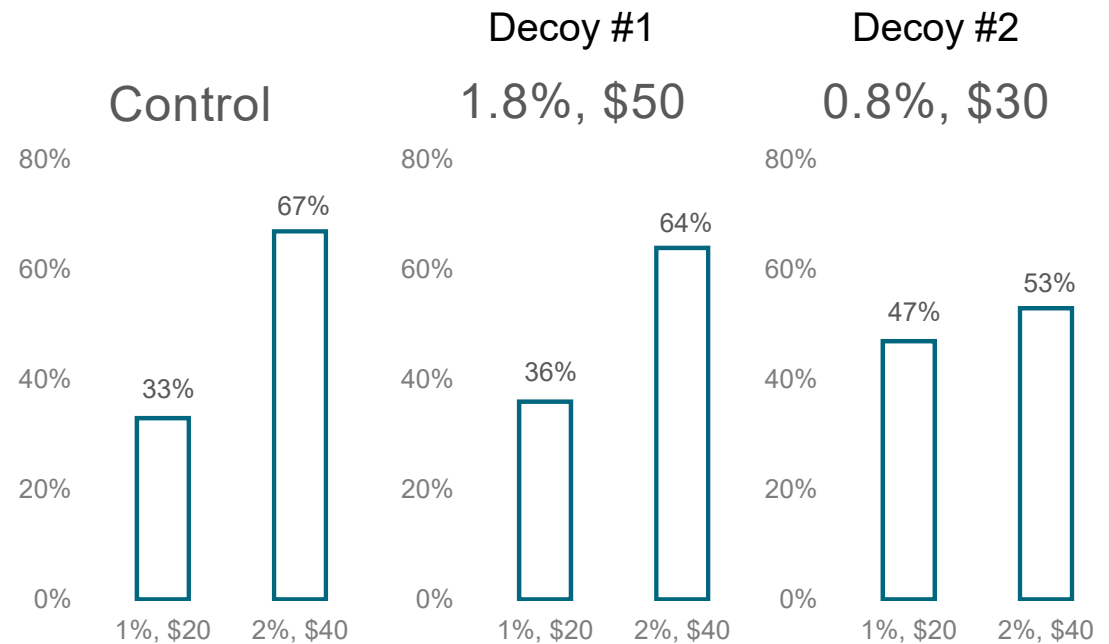

Assume you are interested in signing up for a new credit card. Below are the options offered by your local bank branch:

Which option would you choose?

- 
- ☐ 1.0% cash back on all purchases with a \$20 annual fee.
  - ☐ 2.0% cash back on all purchases with a \$40 annual fee.

- 
- ☒ 0.8% cash back on all purchases with a \$30 annual fee. **(1.8%, \$50)**
  - ☐ 1.0% cash back on all purchases with a \$20 annual fee.
  - ☐ 2.0% cash back on all purchases with a \$40 annual fee.

# Your Data: Perceptual Influence

Imagine you received a bottle of wine produced in Brazil as a gift from a friend because you did her a favor.

---

Now imagine you went to the closest wine store and noticed a section of Brazilian wines. There are five wines from Brazil in this section and their prices are the following:

**\$6.99 ; \$7.99 ; \$8.99 ; \$10.99 ; \$15.99 (your wine) ; \$16.99    Left Skew Context:**

**\$6.99 ; \$15.99 (your wine) ; \$20.99 ; \$22.99 ; \$23.99 ; \$49.99    Right Skew Context**

>>

# How Would you Evaluate a \$15.99 Bottle of Wine from Brazil?

It depends on the context in which the product was judged (7-point scales).

**A**  
**Left Skew Context:**  
\$6.99; \$7.99; \$8.99; \$10.99; **\$15.99**; \$16.99

**B**  
**Right Skew Context:**  
\$6.99; **\$15.99**; \$20.99; \$22.99; \$23.99; \$49.99

Cunha, M. and J. Shulman (2011) "Assimilation and Contrast in Price Evaluations," *Journal of Consumer Research*, 37 (5) 822-835.

# The Power of "Free"

- 1 Lindt truffle = \$0.04
- 1 Hershey's Kisses = \$0.01

- 1 Lindt truffle = \$0.03
- 1 Hershey's Kisses = "Free"

# The Power of "Free"

A

- 1 Lindt truffle = \$0.04
- 1 Hershey's Kisses = \$0.01

B

- 1 Lindt truffle = \$0.03
- 1 Hershey's Kisses = "Free"

# Are Preferences Consistent Across Time?

## Temporal Discounting (Hyperbolic Discounting)

Would you rather receive \$100 right now or \$110 tomorrow?

Would you rather receive \$100 in one hundred days or \$110 in one hundred and one days?

# Are Preferences Consistent Across Time?

## Temporal Construal Theory

Resisting temptation

Saying "no"

Showing moral courage\*

Making a list

Getting organized\*

Writing things down

Reading

Following lines of print

Gaining knowledge\*

concrete, complicated,  
unstructured, not  
integrated, contextual,  
secondary, superficial,  
low, unrelated to goals,  
corresponds to "how"  
questions

Abstract, simple,  
structured, integrated,  
out of context, primary,  
neutral, related to high  
goals, corresponds to  
"why" questions

## Implications for Marketing and Sales

Use dominated options (decoys) with features similar (but inferior) to the most profitable offering

Skew the distribution of prices/quality/features to make your most profitable offering more attractive

When possible, bundle products in a way that one of the products is offered for “free”

## Implications for CR & I

Context may strongly influence judgements

The skewness of a distribution affects perception about the target stimuli

Dominance of alternatives in a survey (decoy) affect perception of value and choice

# Prospect Theory

Understanding Choice  
under Risk

Kahneman & Tversky (1979)

**Terry College of Business**  
*Master of Marketing Research*  
**UNIVERSITY OF GEORGIA**

# Value Function (choice under risk)

**You must pick one of the following gambles:**

- Choice A: You have a 50% chance of winning \$1,000, and a 50% chance of winning \$0
- Choice B: You have a 100% chance of winning \$450.

Which option has a greater expected value?

**Option A = 50%\*\$1,000 = \$500**

Option B = 100% \* \$450 = \$450

# Value Function (Choice Under Risk)

**You must pick one of the following gambles:**

- Choice A: You have a 50% chance of losing \$1,000, and a 50% chance of losing \$0.
- Choice B: You have a 100% chance of losing \$450.

Option A =  $50\% \times -\$1,000 = -\$500$

**Option B =  $100\% \times -\$450 = -\$450$**

Because of loss aversion:

Risk aversion in the domain of gains

Risk seeking in the domain of losses

# Framing Effect in the Context of Losses and Gains

Imagine you and a colleague traveled to a small town on a business trip. After traveling all day, you and your colleague decided to order a large pizza and an order of 12 wings at the hotel. There are only two pizza places that deliver to your hotel and they are both running a promotion on pizza and wing combos. At both places, the regular prices of a large pizza and 12 wings are:

Large Pizza = \$20.00  
12 Wings = \$20.00

The current promotions from each place are presented below. Assuming all else equal (quality, the speed of delivery, customer satisfaction, cleanliness, etc), please select the pizza place from which you'd order:

Buy a large pizza for \$20.00 and get the order of 12 wings for \$10.00	Get a large pizza for \$10.00 when you buy the order of 12 wings for \$20.00
<input type="radio"/>	<input type="radio"/>

Based on Janiszewski and Cunha (2004) – “The Influence of Price Discount Framing on the Evaluation of a Product Bundle,” *Journal of Consumer Research*

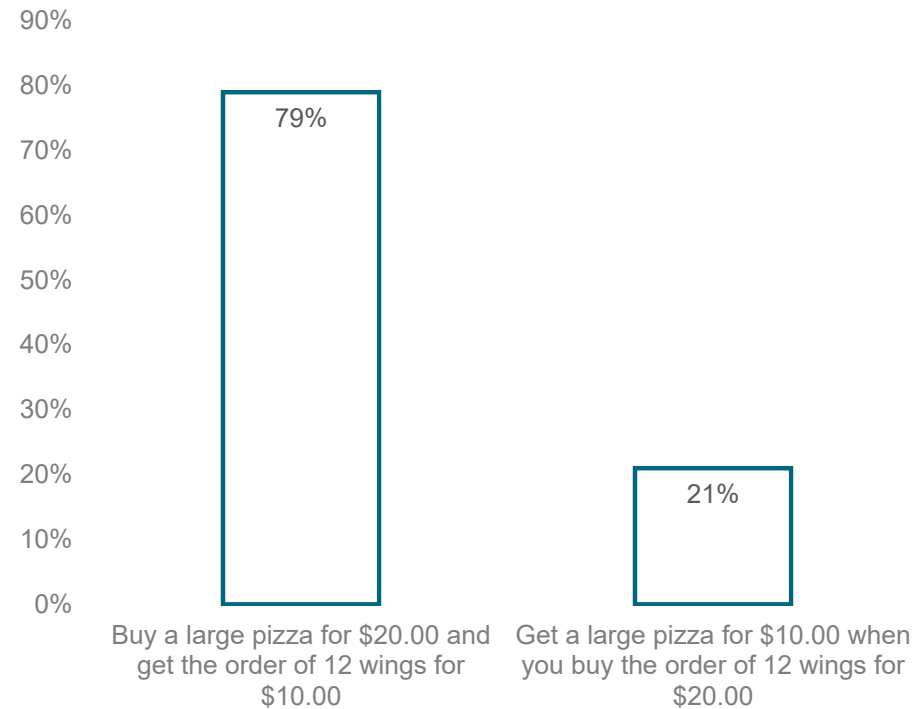

## Framing Effect

Regular prices on the menu:

Large Pizza = \$20.00

12 Wings = \$20.00

### Choice of Promotion

# Value Function

## Properties:

- Events are judged relative to an (adaptive) reference point
- Losses loom larger than gains
- People tend to be averse to losses (“loss aversion” effect)

# Reference Point Example:

Assume that as soon as you graduated from college, you received two job offers with a guaranteed three-year contract each. The contracts, in terms of base salary, are as follows:

	Y1	Y2	Y3
Offer A	\$60K	\$70k	\$80K
Offer B	\$80K	\$70k	\$60K

Which offer would you choose?

# Framing Effects in the Market: Gains and Losses

Negative Frame

Positive Frame

# Loss Aversion Examples

For example, some workers may prefer not to work overtime because they do not want to pay more taxes even if they would benefit financially from additional after-tax income (the additional tax “loss” looms larger than the income “gain”)

Disposition effect: Even though the most rational behavior would be to hold on to winning stocks and sell losing stocks, the opposite is often observed

# Loss Aversion in Practice

Mr. A and Mr. B bought scratch-off lottery tickets. Mr. A. won \$100 and Mr. B won \$50. When Mr. A left the store, he realized he had parked in an illegal zone and received a \$50 parking ticket.

Who is happier?

Definitely Mr. B

Definitely Mr. A

>>

Let's examine the results of this question in light of the Value function

Mr. A and Mr. B bought scratch-off lottery tickets. Mr. A won \$100 and Mr. B won \$50.

When Mr. A left the store, he realized he had parked in an illegal zone and received a \$50 parking ticket.

Who is happier?

Who is Happier?

# Hedonic Editing

- Segregate Multiple Gains (e.g., share good news over multiple conversations)
- Aggregate Multiple Losses (e.g., pay all your bills at once)
- Aggregate Large Gains with Small Losses (e.g., have your parking pass deducted from your paycheck rather than paying it separately)
- Segregate small gains from large losses (the “silver lining”)  
(e.g., save a little more than you will spend on that big vacation)

# Mental Accounting/Hedonic Editing: Your Data

Suppose you bought a case of 2007 Napa Valley Pinot Noir for \$25 a bottle when it first came on sale.

The wine now sells at auction for about \$75 a bottle. Tonight, you have decided to drink a bottle of that wine. Which of the following best captures your feeling of the cost of drinking this bottle of wine?

# Implications for Marketing and Sales

Frame offers as gains versus losses depending on the intended behavior (risk seeking vs. risk averseness)

Hedonically edit offers (e.g., two separate gains and one combined loss)

When offering a bundle, discount the least desirable product for each segment

## Implications for CR & I

The framing of a question (as gain/loss/neutral) has relevant impact on the results of research

People might hedonically edit a question to justify their answers

Take into consideration the inherent risk of the product category relative to the framing of the question

## My Advice

- Know the research problem and use the best tools to solve the problem. Behavioral Economics and Neuro-Marketing are additional tools in your toolbox
- Do not build a wall so you can use your new shining power drill

# Thank You!
